Continuation of 11. does NOT place the application in condition for allowance because: 1. In response to applicant's argument that the prior art does not teach "a rotor position estimating section for calculating electrical angle of the rotor" a recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. In response to applicant's argument that "..., the phase difference detector and the motor rotation control part do not teach or suggest an angular speed calculating section for calculating an angular speed of the rotor of the motor by detecting a maximum value in the back-EMF of each phase.", a recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. Kokami et al teach an angular speed calculating section (22/32; col. 4:37-47) for calculating angular speed (col. 4:66-5:5, calculating broadly being judging) of the rotor by detecting a maximum value (22 detect the bemf and 32 detects the maximum value of the speed utilizing the bemf (col.1:32-54; 4:61-5:6, the maximum value, being the "increasing to a certain degree". Also applicants claim language reads "wherein the rotor position estimating section comprising;".
